

Overview

This document outlines the criteria that must be met for any work item to be considered "done" in our project.

Required Criteria

1. Code Quality

- Code follows the established Style Guide
- Code is properly commented and documented
- Variable and function names follow naming conventions

2. Testing

- All code has been tested for bugs and edge cases
- See [Broken List](#) for known bugs
- See unit test

3. Version Control

- Code has been successfully merged into the main branch
- All merge conflicts have been resolved
- Branch has been deleted after successful merge

Verification Process

Before marking any item as complete:

1. Developer performs self-review against DoD criteria
2. Team lead or peer verifies all criteria are met
3. Final confirmation that code is successfully running on the main branch

Notes

- All team members must understand and follow these criteria
- The DoD may be updated as project needs evolve
- Any exceptions must be documented and approved by the team lead
